The Super Skinny SEO Summary

There are 2 halves to good search engine rankings:

1. compelling text content that is relevant to your audience and frequently added to or updated
2. quality links *coming* into your site. Quality links on your site to other sites

The 5 Most Common Reasons Web Sites don't come up on Search Engines

1. **Too little content.** There is not enough plain text available for the search engines to really infer anything about the site.

2. **Unfocused content.** Not enough thought has been given to what keyword phrases the site should be built around. This should be known before a single stroke of code is written. Your site has to be demonstrative; it has to really be clear what the topic is.
3. **No backlinks.** The site lacks quality in bound links. The inbound links should be themed, and not from random sources.
4. **No attempt to link out.** The site does not demonstrate an effort to link out to other web sites i.e. the site does not add value to your visitor's experience by recommending other sites.
5. **Just plain old.** Newer technologies are better understood by Google eg. WordPress is very well indexed by Google. Old sites often have old code structures that hold a site back e.g frames, iframes, Flash, slicing, cloaking and redirects.

The Importance of Inbound Linking

1. Try to get a minimum of **75 in-bound links** from sites with relevant content to your user group. Try to develop a theme with your inbound links so a search engines is in no doubt what industry group you belong to.
2. Look for inbound links with **high PageRank™**. Links from pages with zero or low PR may hold you back.
3. Try to "theme" your in-bound links.
4. Use your keywords in your in-bound link labels i.e. the text that the link is under on the referring site.
5. Link out to important and busy resources, try to think of what outbound links will add value to your visitor's experience of your website.
6. Avoid FFA ("free for all") link directories as your may be penalised for listing on some of them. They can look like spam to Google.
7. Don't spam guestbooks or comments boxes (a technique

that dynamically inserts links on web pages with a comments section or guestbook).

8. Use keywords in your link labels, not “click here” or “more”.

Don't Do These

1. No tricks (bogus links pages, text the same colour as the background, doorway pages, many urls that forward into your site)
2. Frames sites do not work – avoid frames, or bury them in the 2nd level of your site
3. [Flash sites](#) do not work. Macromedia has a tool from converting a flash animation/presentation to a an HTML document... not sure exactly what you would do with it after that...
4. Use cloaking (serving one page to a Search Engine and another to a user)
5. Have Java navigation. Java is difficult to index and links may not be followed. Also, maybe be difficult to use on a tablet or mobile phone.
6. Put text content in jpegs or gifs because it looks better. Text that is part of a picture can not be read by Google.

How Long Should it Take to Come Up on Search Engines?

Well, if your site only has a little text and is poorly constructed, it will simply not happen. If you site is a Flash animation... ditto. If your site is in frames... ditto.

If your site has good text, the domain name has been around a while, the site is linked well, it's content changed or improved frequently... about 4 days... but unlikely to come up on

the first page of search results.

Substantial revisions to your site may improve its ranking almost straight away. The Google bot does after all come by every 3 to 5 days.
